

ELECTRICAL PANEL FOR PELLETS THERMAL GROUP CONTROL

FRONTAL PROGRAMMING BOARD

PRE WIRED BURNER CONNECTIONS

ELECTRICAL PANEL BACK SIDE
BOILER AND FEEDING CONNECTIONS

ELECTRICAL PANEL ON BOILER

CHARATERISTICS

The electrical panel is arranged for driving the burner, the boiler and the eventual system for hot sanitary water production. It can be placed on boiler and it is possible to link it to an external chrono-thermostat for environment thermo regulation and remote alarm trigger. All electrical connections are pre-wired and so the burner installation on heating generator is faster. The frontal programming board, which controls all functions, is very simple. The double central displays, thank to two lighting led shows the temperatures checked by boiler's water probes, the alarm trigger and the maintenance state. The keys allows the regulation of set point temperature, the selection of instant power on five pre established levels and the regulation differential. There is also another electrical panel version which can be installed on wall with the same characteristics.
